

Android Architecture

A good starting point is the [Guide to App Architecture](#). This is a good overview that introduces the [Architecture components](#) and a code example of the `ViewModel` and `LiveData`.

Beyond the guide, use the [Android lifecycle-aware components codelab](#) and its tutorials to implement each architectural component idea, starting with a `ViewModel` example and in a subsequent example sharing the `ViewModel` between two fragments.

Many of these ideas are implemented in a series of `todo` app implementations. Beyond a good understanding of the `mvc` pattern in the lab exercises; try the `Model-View_Presenter` (MVP) architecture in this sample [todo-mvp app](#)
